

ONBOARDING

Sanofi & Dupixent

Brand research for the Veeva Crossix Services team

Prepared by Michelle An

Sanofi at a Glance

1

Global Biopharma Leader

French multinational pharmaceutical company that spans Biopharma and Vaccines, with a growing Immunology and Rare Disease footprint.

2

Leadership Transition

Recently underwent a CEO change, with new leadership signaling increased strategic rigor across the portfolio.

3

Co-Marketing Structure

Dupixent is co-developed and co-marketed with Regeneron. Commercial data and decisions are shared across both companies.

Why it matters: onboarding to this account means understanding a company whose near-term growth story is increasingly tied to one brand, Dupixent.

Dupixent: The Growth Engine

9 yrs

On market since March 28, 2017, FDA approval

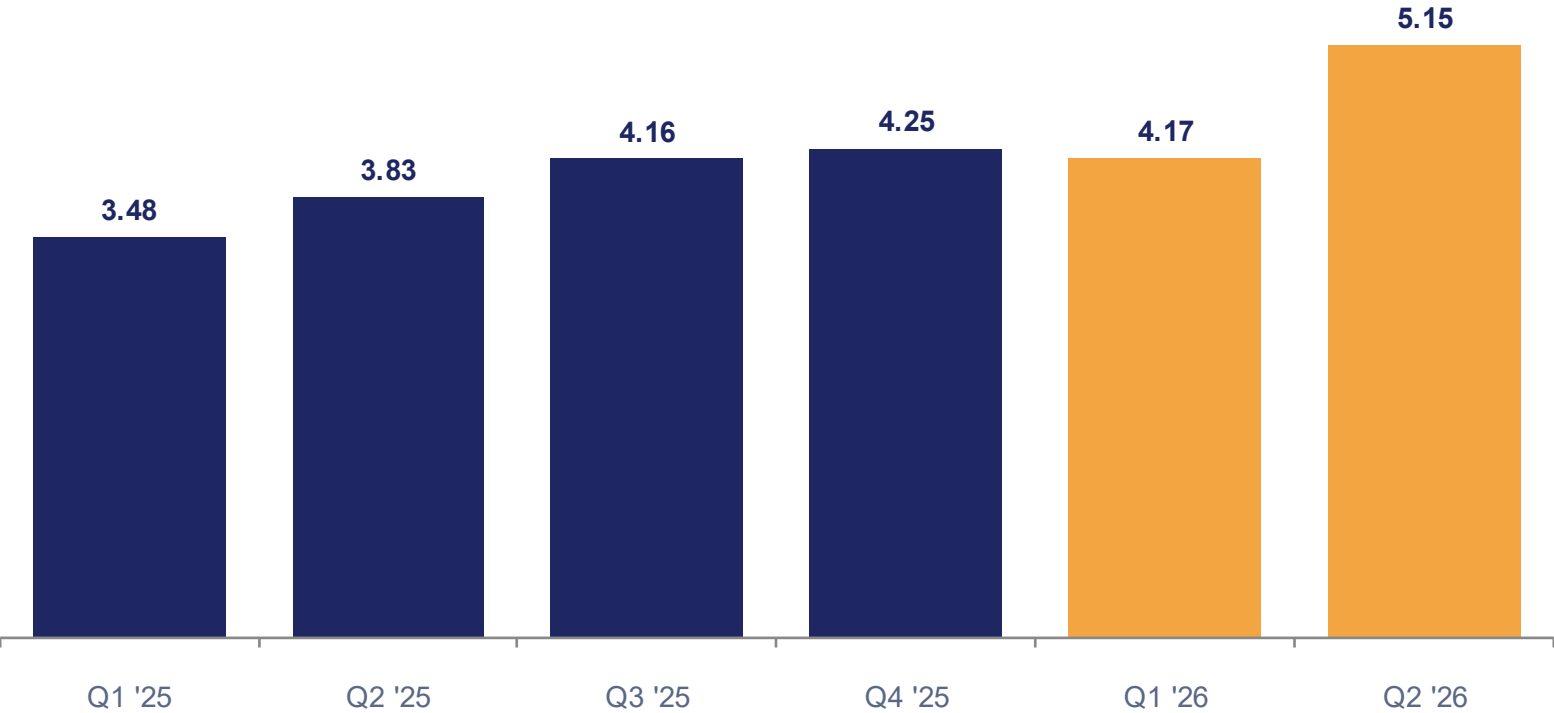

34.4%

H1 2026 sales growth at constant exchange rates

#4

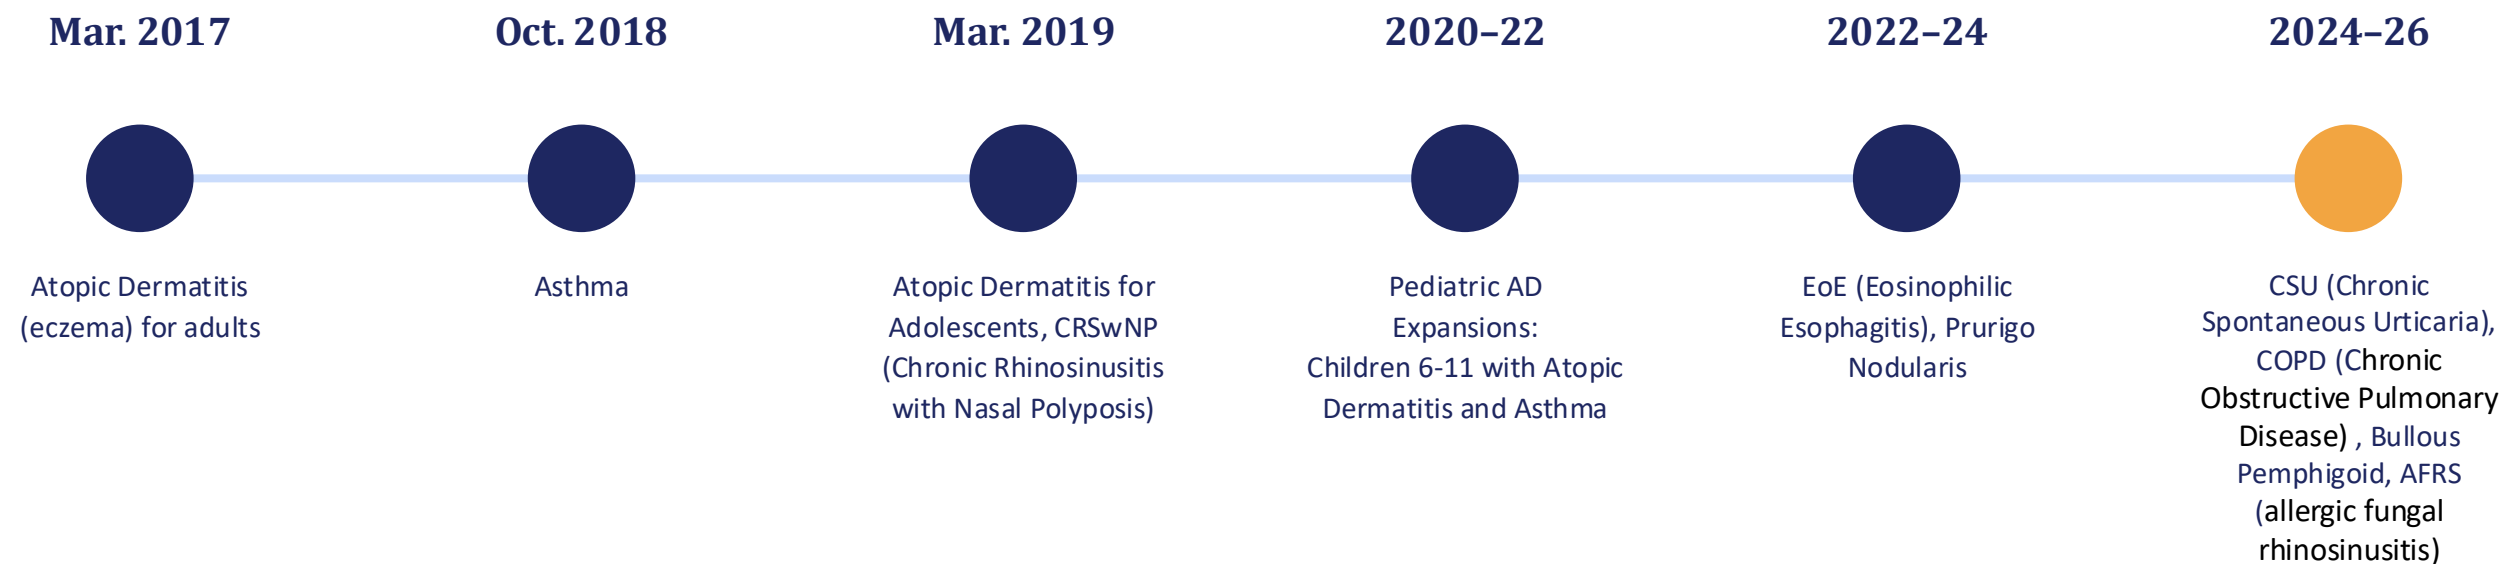

Best-selling prescription drug globally

Quarterly Dupixent Net Sales (€ Billions)

Q2 2026 marked the first time Dupixent crossed €5B in a single quarter — six straight quarters of acceleration.

Indication Expansion Timeline

Takeaway: Nine approved indications across four therapeutic areas of Dermatology, Respiratory, Sino-Nasal, and Gastroenterology. This makes it the broadest label of any biologic in its class, and the core driver behind sustained sales growth.

What Dupixent Treats

Dermatology

- Atopic dermatitis
- Prurigo Nodularis
- Chronic Spontaneous Urticaria (Hives)
- Bullous Pemphigoid

Respiratory

- Moderate-to-Severe Asthma
- Chronic Obstructive Pulmonary Disease (COPD)

Sino-Nasal

- Chronic Rhinosinusitis with Nasal Polyps (CRSwNP)
- Allergic Fungal Rhinosinusitis (AFRS)

Gastroenterology

- Eosinophilic Esophagitis (EoE)

Competitive Landscape

Atopic Dermatitis

Ebglyyss (biologic), Adbry (biologic), Rinvoq (oral Janus kinase inhibitors)

Asthma / Respiratory

Xolair, Nucala, Fasenra — established biologics with limited AD overlap

Emerging Threats

OX40(L) and IL-33 antibodies in development across multiple indications

Differentiators of Dupixent

1. Broadest multi-indication label in its class

- It can serve patients with overlapping conditions that single-indication competitors can't address.
- Regulatory approvals in more than 60 countries and being use by more than 1.4 million patients globally.

2. First-mover biologic status in atopic dermatitis

- First biologic approved for AD (2017), ahead of the oral JAK inhibitors that followed.
- Entrenched prescriber base and longer real-world safety data.

3. Mechanism-based safety profile vs. Oral JAK inhibitors

- It is a targeted IL-4/IL-13 pathway antibody rather a broader oral immunosuppressant.
- It does not carry the same class-wide warnings of blood clots, cardiovascular events, etc.

The Marketing Challenge

As Dupixent expands, the challenge shifts from simply generating awareness to identifying which media reaches the right patients and physicians most efficiently.

QUESTIONS THAT MAY BE ASKED

1

Who are we reaching?

Are exposed consumers diagnosed with the relevant condition? Are physicians treating the right patient populations?

2

Which channels are working?

TV vs. paid search vs. display vs. video, for example.

3

Where is media waste occurring?

Are publishers generating huge reach but poor target concentration?

4

Which audiences respond?

Are certain indications, specialties, geographies, or patient profiles showing stronger engagement?

5

Is incremental spend producing incremental impact?

Should money move between publishers or channels?

Crossix's role: Connects marketing exposure to health data in a privacy-safe, HIPAA-compliant way; measuring consumer and physician campaigns across display, video, paid search, and TV.

What to Monitor for Sanofi

Reach

How many relevant patients/HCPs were exposed?

Quality

What proportion of the exposed population actually fits our desired patient profile?

Efficiency

How much are we spending to reach each qualified patient?

Optimization

Which publishers/channels should receive more or less investment?

Why This Matters for Marketing Performance

1

High-Visibility Account

Dupixent is currently carrying Sanofi's growth narrative, measurement decisions here draw more scrutiny than on a mature, flat brand.

2

Multi-Indication Complexity

Targeting and audience-quality metrics need to be indication-aware, not just brand-aware, as the label keeps expanding.

3

Growing Competitive Noise

Oral JAK inhibitors like Rinvoq and Cibinqo are advertising heavily, raising the bar for message differentiation.

What the Team Needs to Know to Support

1

Indication-aware audience quality metrics: A campaign tuned for AD patients isn't automatically well-targeted for COPD or CSU patients.

2

Regeneron co-marketing structure has implications for shared or coordinated commercial reporting.

3

Elevated organizational stakes given Dupixent's outsized role in Sanofi's current growth story.

Thank you!

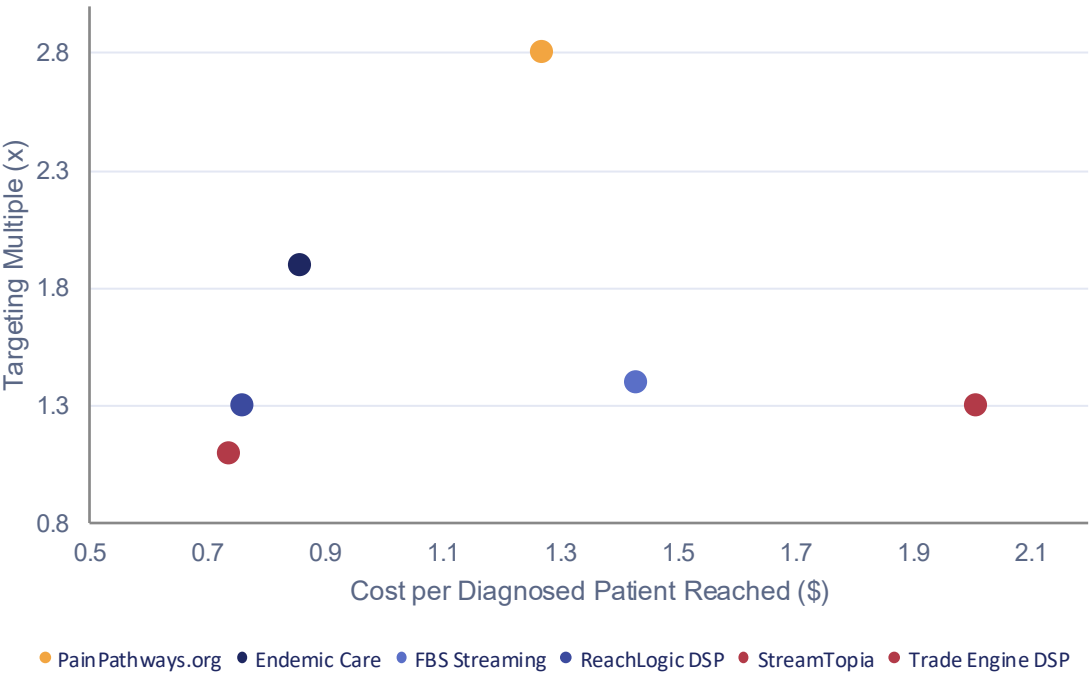

Verteo’s VODERAL Campaign Performance Overview

Plaque Psoriasis Digital Media Campaign

CHANNEL PERFORMANCE

Publisher/Demand Slide Platform	Reach Volume	Target	Spend	\$/Pt	Status
PainPathways.org	553,068	2.8x	\$700K	\$1.27	Retain
Endemic Care	990,023	1.9x	\$850K	\$0.86	Retain
FBS Streaming	503,203	1.4x	\$720K	\$1.43	Retain
ReachLogic DSP	1,310,589	1.3x	\$1.0M	\$0.76	Retain
StreamTopia	448,808	1.3x	\$900K	\$2.01	Remove
Trade Engine DSP	1,630,903	1.1x	\$1.2M	\$0.74	Remove

COST EFFICIENCY VS. TARGETING PRECISION

Recommendation: Remove Trade Engine DSP and StreamTopia

Trade Engine DSP is the largest single line item (22% of spend) yet has the weakest targeting multiple (1.1x); StreamTopia is tied for lowest targeting precision (1.3x) and is the least cost-efficient channel overall (\$2.01 per diagnosed patient). Cutting both frees **\$2.1M (39% of spend)** to reallocate toward PainPathways.org and Endemic Care, improving overall targeting precision without new budget.
